

國立中央大學104學年度碩士班考試入學試題

所別：機械工程學系碩士班 甲組(固力與設計)(一般生) 科目：材料力學 共 1 頁 第 1 頁
 機械工程學系光機電工程碩士班 乙組(光機)(一般生)

本科考試可使用計算器，廠牌、功能不拘

*請在答案卷(卡)內作答

- As shown in Fig. 1, a slightly tapered bar AB of circular cross section and length L is supported at end B and subjected to a tensile load P at the free end A . The diameters of the bar at ends A and B are d_1 and d_2 , respectively. (a) Derive a formula for the strain energy U of the bar. (b) Derive a formula for the elongation δ of the bar due to the load P . (25%)
- As shown in Fig. 2, assume the reaction on the railway tie is uniformly distributed over its length. (a) Draw the shear and moment diagram for the railway tie; and (b) If the maximum allowable bending stress of the wood is 6 MPa, determine the minimum thickness h of the rectangular cross sectional area of the tie. (25%)
- As shown in Fig. 3, a simply supported beam is loaded by a noncentral load P . Suppose that the flexural rigidity of the beam EI has been known already. (a) Construct the bending moment diagram for the beam. (10%) (b) Use the moment-area method (sometimes called area-moment method) to determine the end slopes, the displacement at the load and the maximum displacement. (15%)
- As shown in Fig. 4, the cylindrical tank is fabricated by welding a strip of thin plate helically and making an angle θ with the longitudinal axis of the tank. The strip has a width w and thickness t . The gas within the tank of diameter d is pressured to p . Please determine the normal stress developed along the strip. (25%)
