1. The random variable X has the distribution function $F(x) = \begin{cases} 0, & x < 0 \\ 1/4, & 0 \le x < 2 \\ 2/4, & 2 \le x < 4 \\ 1, & 4 \le x \end{cases}$

   (a) Find the mean of X. (5%)

   (b) Find the moment-generating function M(t) of X. (5%)

2. Let $\bar{X}$ be the sample mean of a random sample of size 3 from the uniform distribution on the interval (0, 3). Use the C.L.T. (Central Limit Theorem) to approximate $P(1/3 < \bar{X} < 4/3)$. (10%)

3. (a) The random variable X has mean 3 and variance 64. If $\hat{\theta}$ is unbiased for X's standard deviation, then what is the mean of $\hat{\theta}$? (5%)

   (b) X_1, X_2, X_3 is a random sample from some population with mean θ and variance σ^2. Let $\hat{\theta}_1 = (X_1 + X_2)/2$ and $\hat{\theta}_2 = (X_1 + X_2 + X_3)/3$. Which estimator would you say is best in estimating θ? (best in the sense minimum variance and unbiased for θ). (5%)

4. Let $X_1, \ldots, X_n$ be a random sample of size n from normal distribution $N(1, \theta)$, $0 < \theta < \infty$ (i.e. mean=1 and variance = θ).

   (a) Derive the best unbiased estimator of θ. (10%)

   (b) Derive the maximum likelihood estimator of θ. (10%)

   (c) Compute the Rao-Cramér lower bound. (5%)

   (d) If $n = 10$, what is the efficiency of maximum likelihood estimator in part (b). (5%)

5. Let $X_1, \ldots, X_4$ and $Y_1, \ldots, Y_9$ be random samples from the independent normal distributions, $N(\mu_x, \sigma_x^2)$ and $N(\mu_y, \sigma_y^2)$, where μ_x, μ_y, σ_x^2, and σ_y^2 are unknown. Suppose sample means $\bar{x} = 60$, $\bar{y} = 58$, sample variances $s_x^2 = 9$ and $s_y^2 = 16$.

   (a) Assume that $\sigma_x^2 = \sigma_y^2$. Find a 98% confidence interval for $\mu_x - \mu_y$. (7%)

   (b) Assume that $\sigma_x^2 = 2\sigma_y^2$. Derive and find a 98% confidence interval for $\mu_x + \mu_y$. (8%)

6. The probability density function of X is defined by $f(x) = \frac{1}{\theta}\exp(-\frac{x}{\theta})$, $0 < x < \infty$, $0 < \theta < \infty$. We shall test $H_0 : \theta = 1$ against $H_a : \theta = 2$ using a single observation of X. Let the critical region be defined by $C = \{x : x > 1\}$.

   (a) Find type I error. (7%)

   (b) Find type II error. (8%)

   (c) Derive a uniformly most powerful test for testing $H_0 : \theta = 1$ against $H_a : \theta < 1$ with the type I error $\alpha = 0.05$. (10%)
